Lit. #: 91-0219/03-01

INSTRUCTION MANUAL

WHERE DO I START?

Your Bushnell telescope can bring the wonders of the universe to your eye. While this manual is intended to assist you in the set-up and basic use of this instrument, it does not cover everything you might like to know about astronomy. Although Northstar will give a respectable tour of the night sky, it is recommended you get a very simple star chart and a flashlight with a red bulb or red cellophane over the end. For objects other than stars and constellations, a basic guide to astronomy is a must. Some recommended sources appear on our website at www.bushnell.com. Also on our website will be current events in the sky for suggested viewing. But, some of the standbys that you can see are:

The Moon—a wonderful view of our lunar neighbor can be enjoyed with any magnification. Try viewing at different phases of the moon. Lunar highlands, lunar maria (lowlands called "seas" for their dark coloration), craters, ridges and mountains will astound you.

Saturn—even at the lowest power you should be able to see Saturn's rings and moons. This is one of the most satisfying objects in the sky to see simply because it looks like it does in pictures. Imagine seeing what you've seen in textbooks or NASA images from your backyard!

Jupiter—the largest planet in our solar system is spectacular. Most noted features are its dark stripes or bands both above and below its equator. These are the north and south equatorial belts. Also interesting are Jupiter's four major moons. Pay close attention to their positions from night to night. They appear to be lined up on either side of Jupiter.

Mars—The Great Red Planet appears as a reddish-orange disk. Look at different times of the year and try to catch a glimpse of the white polar ice caps.

Venus—just like the moon, Venus changed phases from month to month. Some views of brilliant Venus appear as if you were looking at a distant crescent moon.

Nebulae—The Great Orion Nebula is a very well known night sky object. This and many others are brought to you by this telescope.

Star Clusters—View millions of stars densely packed in a cluster that resembles a ball.

Galaxies—One of the greatest and most interesting galaxies is our neighbor the Andromeda Galaxy. Enjoy this and many others.

PARTS DIAGRAMS

78-7860 60MM REFRACTOR 3 78-7880 8

IMPORTANT:

READ THROUGH ASSEMBLY INSTRUCTION BEFORE YOU ASSEMBLE YOUR TELESCOPE.

TELESCOPE PARTS DIAGRAM

- 1. Wide Field Finderscope
- 2. 1.25" Format Eyepiece
- 3. Penta Mirror
- 4. Rack and Pinion Focusing Mechanism
- 5. Accessory Tray Brace

- 6. Quick-Release Tripod Leg Lever
- 7. Quick-Release Accessory Tray
- 8. Onboard Computer
- 9. Main Telescope Tube
- 10. Quick-Release Adjustable Aluminum Tripod

QUICK ASSEMBLY DIAGRAM

QUICK ASSEMBLY DIAGRAM

PARTS LIST

- Adjustable Aluminum Tripod Assembly (Three Legs)
- Quick Release Accessory Tray
- Northstar Computerized Star Locator Base
- Northstar Telescope Tube w/ finger attachment nuts
- Wide Field Finderscope

- 20mm 1.25" Diameter Eyepiece
- 4mm 1.25" Diameter Eyepiece
- Barlow Lens
- Erecting Lens (not included with model 78-7830)
- Penta Mirror (not included with model 78-7830)

DETAILED ASSEMBLY

No tools are required for assembly of your telescope.

Remove all components from the carton and identify all components. It is a good idea to lay all the parts out in front of you before assembly. Since your telescope is a precision optical system the parts require careful handling—particularly the onboard computer, telescope, eyepieces, and various accessory lenses.

SET-UP TRIPOD AND ACCESSORY TRAY

- 1. Stand Northstar Computerized Star Locator Assembly and attached tripod legs in the upright position. Spread tripod legs to a comfortable distance.
- 2. Fold down the accessory tray braces and place the Quick Release Accessory Tray on top of braces. (See Quick Assembly Diagram)
- 3. Turn accessory tray until it snaps into place.
- 4. Adjust tripod leg height to suit by opening tripod leg lever and extending tripod legs to desired height. Clamp Tripod Leg lever closed when complete.

ATTACH TELESCOPE TUBE

- 1. Locate Main Telescope Tube.
- Remove Telescope Tube Thumb Nuts from side of Telescope Tube. (See Quick Assembly Diagram)
- 3. Position Main Telescope Tube Attachment Bolts through Telescope Tube Bracket at the top of the Northstar Computerized Star Locator Assembly. Make sure the telescope is pointing in the correct direction. (Logo on telescope tube should be right side-up.)
- 4. Reattach Telescope Tube Thumb Nuts to Main Telescope Tube Attachment Bolts once Main Telescope Tube and Northstar Computerized Star Locator Assembly are assembled together.

ATTACH FINAL TELESCOPE ACCESSORIES

1. Locate Wide Field Finderscope.

For Refractor Telescopes: Northstar Refractor Telescope Models have Finderscope Mount already attached to Main Telescope Tube. Simply place the Wide Field Finderscope into the Finderscope Mount by backing out the Finderscope Adjustment Screws to allow Finderscope to be fully inserted into the Finderscope Mount.

NOTE: Finderscope should be facing forward (Large end nearest the lens end of the telescope tube).

For Reflector Telescopes: Remove Finderscope attachment nuts from Main Telescope Tube. Place Finderscope Assembly over Finderscope Attachment Bolts and reattach Finderscope thumb nuts to Finderscope Mount Bolts.

NOTE: Finderscope should have large end of the finderscope facing open end of telescope tube.

2. Attach Low Power Eyepiece:

For Reflector Telescope Models: Insert lowest power eyepiece in the focusing mechanism by backing out eyepiece set screw and inserting eyepiece fully.

For Refractor Telescope Models: Insert lowest power eyepiece into the penta mirror by backing out eyepiece set screw, then insert penta mirror into the focusing tube of the Main Telescope Tube by backing out focusing tube set screw.

- 3. Tighten all set screws to secure accessories.
- 4. Remove Objective Dust Cover and Finderscope Dust Cover Caps.

DETAILED ASSEMBLY (CONTINUED)

SELECTING AN EYEPIECE

You should always start viewing with the lowest power eyepiece, which in this case is the 20 mm lens. Note: the base power of each eyepiece is determined by the focal length of the telescope objective lens. A formula can be used to determine the power of each eyepiece: telescope OBJECTIVE lens focal length divided by EYEPIECE focal length = MAGNIFICATION (e.g. Using the 20 mm lens, a sample calculation could look like this: 750 mm / 20 = 38x or 38 power. Telescope models will vary in focal length.)

Included with this telescope is a Barlow lens. Barlow lenses are used to double or triple the power of your telescope. Place your Barlow between the focusing tube and the eyepiece. Using the example above, your 3x Barlow lens would give you a total power of 114x or 114 power. ($38 \times 3 = 114x$ or 114 power). The magnification calculation would look like this: 750 mm/20mm = 38 power. $38 \text{ power} \times 3 = 114 \text{ power}$.

FOCUSING TELESCOPE

- 1. After selecting the desired eyepiece, aim main telescope tube at a land-based target at least 200 yards away (e.g. Atelephone pole or building).
- 2. Fully extend focusing tube by turning Rack and Pinion Focusing Mechanism.
- 3. While looking through selected eyepiece (in this case the 20 mm), slowly retract focusing tube by turning Rack and Pinion Focusing Mechanism until object comes into focus.

ALIGNING FINDERSCOPE

Look through Main Telescope Tube and establish a well-defined target. (see focusing telescope section)

Looking through Wide Field Finderscope, alternate tightening each Finderscope Adjustment Screw until crosshairs of Wide Field Finderscope are precisely centered on the same object already centered in Main Telescope Tube's field of view.

Now, objects located first with the Wide Field Finderscope will be centered in the field of view of the main telescope.

Never Look Directly At The Sun With Your Telescope Permanent Damage To Your Eyes May Occur

ENJOYING YOUR NEW TELESCOPE

- 1. First determine your targeted object. Any bright object in the night sky is a good starting point. One of the favorite starting points in astronomy is the moon. This is an object sure to please any budding astronomer or experienced veteran. When you have developed proficiency at this level, other objects become good targets. Saturn, Mars, Jupiter, and Venus are good second steps to take.
- 2. The first thing you need to do after assembling the telescope as planned is center the desired object in the finderscope's cross hairs. Provided you did a reasonable job aligning the finderscope, a quick look through the main telescope tube at low power should reveal the same image. With the lowest power eyepiece (the one with the largest number printed on it) you should be able to focus the same image that you saw through the finderscope. Avoid the temptation to move directly to the highest power. The low power eyepiece will give you a wider field of view, and brighter image—thus making it very easy to find your target object. At this point with a focused image in both scopes, you've passed the first obstacle. If you don't see an image after attempting to focus it in, you might consider aligning your finderscope again. Once you pass this step, you'll will enjoy the time spent ensuring a good alignment. Every object you center in the finderscope will be easily found in the main telescope tube, which is important for continuing your exploration of the night sky.
- 3. The low power eyepieces are perfect for viewing the full moon, planets, star clusters, nebulae, and even constellations. These should build your foundation. However, for more detail, try bumping up in magnification to higher power eyepieces on some of these objects. During calm and crisp nights, the light/dark separation line on the moon (called the "Terminator") is marvelous at high power. You can see mountains, ridges and craters jump out at you due to the highlights. Similarly, you can move up to higher magnifications on the planets and nebulae. Star clusters and stars are best viewed through the low power no matter what.
- 4. The recurring astronomical theater we call the night sky is an ever-changing billboard. In other words, not the same movie plays all the time. Rather, the positions of the stars change not only hourly as they seem to rise and set, but also throughout the year. As the earth orbits the sun our perspective on the stars changes on a yearly cycle about that orbit. The reason the sky seems to move daily just as the sun and the moon "move" across our sky, is that the earth is rotating about its axis. As a result you may notice that after a few minutes or a few seconds depending on what power you are viewing at, the objects in your telescope will move. At higher magnifications especially, you will notice that the moon or Jupiter will "race" right out of the field of view. To compensate, just move your telescope to "track" it in the necessary path.

HELPFUL HINTS

- 1. Your telescope is a very sensitive instrument. For best results and fewer vibrations set your telescope up on a level location on the ground rather than your concrete driveway or your wooden deck. This will provide a more stable foundation for viewing, especially if you've drawn a crowd with your new telescope.
- 2. If possible view from a location that has relatively few lights. This will allow you to see much fainter objects. You'd be surprised how much more you'll see from your local lake or park when compared to a backyard in the city.
- 3. Using your telescope out a window is NEVER recommended.
- 4. View objects that are high in the sky if possible. Waiting until the object rises well above the horizon will provide a brighter and crisper image. Objects on the horizon are viewed through several layers of earth's atmosphere. Ever wonder why the moon appears orange as it sets on the horizon. It's because you are looking through a considerable more amount of atmosphere than you would directly overhead. (Note: If objects high in the sky are distorted or wavy, you are probably viewing on a very humid night.) During nights of unstable atmosphere, viewing through a telescope can be frustrating if not impossible. Astronomers refer to crisp, clear nights as nights of "good seeing."

BUTTON FUNCTIONS

Back Button: This button functions to navigate to the previous level within the operating framework and/or back to the previous level of input.

Enter Button: This button functions to select certain menu choices. By pressing the ENTER button Northstar will advance to the selected level. When an object name or number is listed on the screen, the ENTER button can also be pressed to display a scrolling text description of the object

Scroll Up Button: This button functions to scroll <u>up</u> through various menus within Northstar. Anytime you encounter a blinking text/number option, the scroll button will display the various choices within that menu. (Note: To select an option that you have scrolled to, just press the ENTER button.

Scroll Down Button: This button functions to scroll <u>down</u> through various menus within Northstar. Anytime you encounter a blinking text/number option, the scroll button will display the various choices within that menu. (Note: To select an option that you have scrolled to, just press the ENTER button.

On/Off/Dim: The On/Off Button will turn the Northstar Computerized Star Locator on and off. Once on, you can adjust the level of LCD Backlight Illumination by pressing the On/Off/Dim Button to cycle through the brightness levels. To turn the unit off, simply depress and hold the On/Off/Dim button for three seconds and release. (Note: The Northstar Computerized Star Locator will automatically turn itself off after 20 minutes of inactivity.)

LCD DISPLAY

The Liquid Crystal Display (LCD) is a two-line, sixteen character display. The LCD also has an electroluminescent backlight for use during nighttime viewing with the Northstar Computerized Star Locator.

MODE OVERVIEW OF PRODUCT

Explore: The Explore Mode of Northstar provides the ability to explore various astronomical objects categorized by object type. These objects would fall under one or more of the following types of objects: Deep Sky, Planets, Constellations, and Stars. Each of these subheadings would also have subcategories of objects beneath their menu structure. (See Menu Tree for full list of menu functions and options.)

Sky Tour: The Sky Tour Mode of Northstar provides the ability to take a quick tour of the best and brightest objects for any given month of the year. If the date has been input into the system, the Sky Tour Mode will automatically default to that month. Objects can be chosen by using the scroll <u>up</u> or <u>down</u> arrows and pressing ENTER. To find out more information about any given object press the enter button while that object is displayed to see the scrolling text message.

Telescope: The Telescope Mode of Northstar provides real-time data on where the telescope is pointing. Astronomical Coordinates for Right Ascension (RA) and Declination (DEC) as well as Altitude (ALT) and Azimuth (AZ) are displayed simultaneously. In addition, in the lower right hand corner will be the abbreviation for the current constellation that the telescope is pointed at.

Identify: The Identify Mode of Northstar provides the ability to Identify any object within your telescope field of view. Subcategories for different classes of identifiable objects are included as well as an Identify Any option.

Align Earth: The Align Earth Mode of Northstar provides the ability to easily align your telescope utilizing common information non-astronomers would readily know. By entering simple information such as time, date, city, etc. a first time telescope user can be exploring the immense Northstar database of astronomical objects within minutes.

Align Star: The Align Star Mode of Northstar provides the ability to align your telescope utilizing some astronomical knowledge. By knowing where two stars are located in the sky, a novice user can circumvent the city, date, and time input and quickly start utilizing the Northstar database to locate amazing astronomical objects.

Align Object: The Align Object Mode of Northstar provides the ability to refine your telescope alignment during the middle of your observing session. This might come in very handy if the family dog has just bumped the telescope out of alignment. By using this mode you can center the telescope on any known object and select align object to quickly recalibrate the Northstar alignment allowing continued enjoyment for the duration of the evening.

ALIGNING NORTHSTAR FOR THE FIRST TIME

When you turn the telescope on a scrolling message will appear:

The first display will then prompt you to level the telescope tube. The display will read:

The display will alternate to:

After the tube is leveled and ENTER is pressed, the display will briefly read

Then the default menu will appear:

This mode assumes that even if the telescope user is a first time user and does not know anything about astronomy that they can be successful aligning the telescope in a few simple steps.

The ALIGN EARTH option is flashing. This indicates that if we press the ENTER key we will then be faced with the ALIGN EARTH menu.

Press ENTER to choose ALIGN EARTH option.

NOTE: ANY FLASHING ITEM ON THE DISPLAY IS A MENU CHOICE. OTHER CHOICES ARE AVAILABLE BY USING THE SCROLL UP OR SCROLL DOWN BUTTONS.

STEP 1: SET THE TIME

By using the SCROLL UP and SCROLL DOWN buttons and the ENTER button, the time can easily be set as well as the time zone. Each flashing option will need to be changed to read the appropriate number. Once the number is displayed, you accept the number by pressing ENTER. Then you would set the next flashing option until the time and time zone are set.

STEP 2: SET THE DATE

Again by using the SCROLLUP and SCROLLDOWN buttons and the ENTER button, the date can easily be set. Each flashing option will need to be changed to read the appropriate number or month. Once the number is displayed, you accept the number by pressing ENTER. Then you would set the next flashing option until the day, month and year are set.

ALIGNING NORTHSTAR FOR THE FIRST TIME (CONTINUED)

STEP 3: SET THE LOCATION

The next screen will display:

CITY will be flashing. By pressing the ENTER button, the display will change to:

The country will be flashing.

Again by using the SCROLL UP and SCROLLDOWN buttons and the ENTER button, the COUNTRY can be chosen. When the appropriate Country is found and the ENTER button is pushed, you would finally choose the city that you were closest to by pressing ENTER when it is displayed.

NOTE: CHOOSE THE CITY CLOSEST TO YOUR VIEWING LOCATION. THIS IS NOTA CRITICALSTEP AND THE ALIGNMENT WILLAUTOMATICALLY BE REFINED AS WE PROGRESS.

STEP 4: POINT NORTH

After choosing the city, the display will read:

POINT MORTH THEN PRESS ENTER

You would then point the telescope in the direction of North and press ENTER.

ALIGNING NORTHSTAR FOR THE FIRST TIME (CONTINUED)

NOTE: THE USER WOULD JUST HAVE TO GET THE TELESCOPE POINTED RELATIVELY CLOSE TO NORTH. THE ALIGNMENT WILL BE REFINED AS WE PROGRESS. HOWEVER, IF YOU CAN FIND THE BIG DIPPER AND USE THE "POINTER STARS", FOLLOW THE ARROW ON THE ABOVE DIAGRAM TO THE NORTH STAR. THE NORTH STAR LIVES DIRECTLYABOVE DUE NORTH!

After pointing the telescope NORTH and making sure the tube is still pointed level, pressing the ENTER button would complete the rough alignment process.

A polite THANK YOU will then be displayed.

After four simple criteria that any consumer should know, the telescope now knows where over 20,000 astronomical objects are in the night sky to a relative precision. With just two more steps, we will zero in on pinpoint accuracy.

Now the telescope will lead us through a simple two star alignment process. WE DO NOT NEED TO KNOW WHERE ANY STARS ARE. We just simply follow the directions.

Ascrolling message indicates to CENTER STAR 1 THEN PRESS ENTER

Then the display will read:

```
CENTER STAR 1
+120 +52 MIZAR
```

The user will simply follow the arrows to zero in on this first guide star. Note that this will be the only bright star in this area of the sky. By following the arrows on the display it will tell us how far away we are from the guide star. Move the telescope tube with your hands until the display reads:

```
CENTER STAR 1
000 000 MIZAR
```

Note as you move from greater than 10 degrees away from an object to under ten degrees, the display moves into tenths of degrees with the arrows acting as decimal points (Example 3:5-3.5 degrees) below the object).

After getting the star zeroed in, you need to do as the screen told you—CENTER STAR 1. In other words, the star might appear in the lower left corner of your telescope's eyepiece.

By looking through the eyepiece, center the star in the field of view and press ENTER.

The distance the object is from the center is related to how far outside of a city you might be located or how accurately you aligned with north.

You would then repeat this process for STAR 2 and press ENTER.

After this step is completed, you will see a display that reads:

```
ALIGN COMPLETE
RATING Heldelek
```

(Note: The more stars that appear on the second line of the display the better, up to 5)

After the two star alignment is complete, your Northstar now knows with pinpoint accuracy where all 20,000+ objects are!!

USING NORTHSTAR FOR THE FIRST TIME

After EARTH ALIGN, the display will then read:

EXPLORE will be flashing. This indicates that you could choose other options by pressing the UP and DOWN buttons. However, let's look at EXPLORE first. This is the default menu at this point because, this will most likely be the most often used mode. This is where the starfinding takes place.

Select EXPLORE by pressing ENTER. SCROLL UP and DOWN to see what flashing menu choices you have. I always choose PLANET. These are the most interesting. Even if you are a first time telescope user, PLANET objects can be very exciting.

Press ENTER when the display reads:

This will take you into a list of named PLANETobjects. By using the SCROLL UP or SCROLLDOWN buttons, you can explore several items in the object list.

Press ENTER to choose the PLANET you wish to view. The display would then be:

NOTE: IF AN OBJECT IS BELOW THE HORIZON, THE DISPLAY WILL PERIODICALLY DISPLAY THE WORD "HORIZON".

SCROLLUP or SCROLLDOWN to see other PLANETS in the list. Notice the display shows you directions to each object. But what if you are a first time user want to find out more about the object? Wouldn't it be nice to know what the object is before moving the telescope?

PRESS ENTER when:

is displayed or any other PLANET item. You will see a scrolling message telling you the coordinates for the object, how bright it is, how big it is, what its proper name is, what constellation it is in, and a brief description of what the object is. For JUPITER it would read:

```
JUPITER fifth planet from sun.
Largest planet in solar system.
16 moors. Orbit is 11.86 years.
Diameter 143.000 km.
Named for roman king of gods.
```

Now imagine that you are a parent trying to impress your kids (or vice versa). Ten minutes into your first observing session you are already learning astronomical objects.

This is a great educational tool!!!!

To find the object, just follow the directions displayed by the arrows until you zero the object out and it will be right in the telescope's eyepiece!

USING NORTHSTAR FOR THE FIRST TIME (CONTINUED)

By pressing the BACK button, you move back to the previous level each time the button is pressed. Press the button three times and you are back at the main level menu. The display will read:

SCROLLUP or SCROLL DOWN to select

Press ENTER.

This mode will take you through the best and brightest objects for each month. If you have done the ALIGN EARTH alignment and entered the date, it will automatically take you to the current month. Don't know what some of these obscure objects and abbreviations mean? Just press the ENTER key for more information.

Press the BACK button until you get back to the main menu:

SCROLL UP or SCROLLDOWN until the display reads:

PRESS ENTER

This mode will default to the level

By selecting this option with the ENTER key, it will IDENTIFYthe object that you are currently viewing OR the closest object to where your telescope is currently pointed. You also have the options to choose other types of IDENTIFY menus. These will IDENTIFY the closest CLUSTERS, NEBULAS, etc. to your current telescope position.

To select the final mode press ENTER at the display:

The display reads something like:

The TELESCOPE mode gives you dynamic real-time information on your telescope's current position in terms of astronomical coordinates. Play around with this mode by moving the telescope around. Notice the three letter abbreviation in the lower right portion of the display. This dynamically displays the current CONSTELLATION that the telescope is pointing at. These names are abbreviated in this mode. Definitions for the abbreviations will be in the catalog index.

CATALOG INDEX

The following appendix information is more thorough information than that listed in the main instruction manual. For sake of space, the complete 20,000 object catalog is not listed. However, we have included the entire star list and the entire Messier object lists for your information. In addition, the constellation abbreviations are defined that are found in the Northstar system.

NORTHSTAR COMPUTERIZED STAR LOCATOR SPECIFICATIONS

Dimensions 3.5 X 4.7 X 1.8

Weight 10 oz including 9V battery

Operating Temperature 10°C à + 50°C Telescope Mounting Altitude / Azimuth

Display Dot Matrix LCD, 2x16 character Alphanumeric

Display Backlight Blue-Green Electroluminescent, 5-brightness levels

Display Resolution 1m right ascension, 10' declination 0.1°

Display Modes ALIGN STAR, ALIGN EARTH, ALIGN OBJECT, TELESCOPE

EXPLORE, SKY TOUR, IDENTIFY

Database 20K Object Database

Complete Messier Catalog – 110 Objects
Complete NGC catalog – 7840 Objects
Complete IC Catalog – 5386 Objects
Selections from ESO Catalog – 1228
Selections from UGC catalog – 2340

Selection from small non-stellar catalogs – 2050 Objects

Selected star, double stars, variable stars, and interesting stars – 837

Objects Alignment start list – 30 Stars

Best of lists – 150 objects

Planet, Moon, Mercury, Venus, Jupiter, Saturn, Uranus, Neptune, Pluto Descriptions include magnitude, constellation, size / separation / type

Set-up Two Methods:

Earth-Based Alignment, using time North and location

Fast two-star alignment, No input for latitude, longitude, date,

or time required

Coordinate Epoch AD 2000

Sensing Method Integral Encoders

Encoder Resolution 9216 steps, 0.02 resolution

Maximum Slew Rate 180° per second

Angle Representation 16 bits Vector Representation 48 bits Sidereal Clock Accuracy 0.01%

Power Requirements 5.1 to 14 Volts DC. 25mA, display fully-dimmed, typical. 35mA, display

maximum brightness, typical. Reverse Polarity Protected.

Battery Life 20 hours with display fully dimmed

SELECT MODE TELESCOPE 144

PRESS ENTER

RA18:53 DEC+38.7 AZ280 ALT+62 LYR

The TELESCOPE mode gives you dynamic real-time information on your telescope's current position in terms of astronomical coordinates. Play around with this mode by moving the telescope around. Notice the three letter abbreviation in the lower right portion of the display. This dynamically displays the current CONSTELLATION that the telescope is pointing at. These names are abbreviated in this mode. Definitions for the abbreviations will be in the appendix.

WARRANTY / REPAIR

TELESCOPE LIFETIME LIMITED WARRANTY

Your Bushnell® telescope is warranted to be free of defects in materials and workmanship for the lifetime of the original owner. The Lifetime Limited Warranty is an expression of our confidence in the materials and mechanical workmanship of our products and is your assurance of a lifetime of dependable service.

If your telescope contains electrical components the electronic components are warranted to be free of defects in materials and workmanship for one year after the date of purchase.

In the event of a defect under this warranty, we will, at our option, repair or replace the product, provided that you return the product postage prepaid. This warranty does not cover damages caused by misuse or improper handling, installation or maintenance of the product.

Any return made under this warranty must be accompanied by the items listed below:

- 1) A check in the amount of \$15.00 to cover the cost of handling
- 2) Name and address for product return
- 3) An explanation of the defect
- 4) Product should be well packed in a sturdy outside shipping carton to prevent damage in transit and return postage prepaid to the address listed below:

IN U.S.A. Send To:

Bushnell Performance Optics 8500 Marshall Drive Lenexa, Kansas 66214

IN CANADA Send To:

Bushnell Performance Optics 25A East Pearce Street, Unit 1 Richmond Hill, Ontario L4B 2M9

For products purchased outside the United States and Canada please contact your local dealer for applicable warranty information. This warranty gives you specific legal rights. You may have other rights which vary from country to country.
